HYCORTISONE as Sodium Succinate

HYZONATE 500 mg Parenteral Solution L.V./I.

Each vial contains: Hydrocortisone (as Sodium Succinate) … 250mg

- Soluble sodium succinate ester of hydrocortisone permits the immediate IV administration of high doses of hydrocortisone in a small volume of diluent and is particularly useful in emergency situations such as shock in which standard therapy (eg. Fluid replacement) has not been effective (see Medical Emergencies: Shock).

- The term administration (to tide the patient over an acute episode) may result in clinical remission. When prolonged therapy is indicated, it is governed by the severity and type of the disease in: Ulcerative colitis (systematic therapy), regional enteritis (systematic therapy), skin diseases, neurodermatitis, acne, lupus erythematosus.

- The use of Hyzonate in patients receiving other immunosuppressive therapy will not interfere with the response to the corticosteroid component. The use of Hyzonate in active lupus erythematosus is not recommended.

- Administration of high doses of corticosteroids, may result in clinical remission. When prolonged therapy is indicated, it is governed by the severity and type of the disease in: Ulcerative colitis (systematic therapy), regional enteritis (systematic therapy), skin diseases, neurodermatitis, acne, lupus erythematosus.

- The use of Hyzonate in patients receiving other immunosuppressive therapy will not interfere with the response to the corticosteroid component. The use of Hyzonate in active lupus erythematosus is not recommended.

- Administration of high doses of corticosteroids, may result in clinical remission. When prolonged therapy is indicated, it is governed by the severity and type of the disease in: Ulcerative colitis (systematic therapy), regional enteritis (systematic therapy), skin diseases, neurodermatitis, acne, lupus erythematosus.

- The use of Hyzonate in patients receiving other immunosuppressive therapy will not interfere with the response to the corticosteroid component. The use of Hyzonate in active lupus erythematosus is not recommended.

- Administration of high doses of corticosteroids, may result in clinical remission. When prolonged therapy is indicated, it is governed by the severity and type of the disease in: Ulcerative colitis (systematic therapy), regional enteritis (systematic therapy), skin diseases, neurodermatitis, acne, lupus erythematosus.
